Section: 22BCD-1
Group: B

First use mkdir/cd to get to the repository, then use git init to start working on the repo.

1. We will firstly use gitbranch to view what all branches are present in the repository.
2. Current branch, by default would be master or 'main' branch.
3. To create a new branch, use git branch "mybranch" to create a new branch.
4. We can view the branches which are present using 'git branch'.
5. Now to move from master branch to my branch, use the command, "git switch "Mybranch" "$.
6. While using git status, while in master branch the output will be shown as 'master' while in mybranch it would be shown as 'branch' only.
7. While in master branch, it would contain readme file, license etc. whereas the new branch i.e. 'mybranch' will be empty ~~whi~~ by default.
8. use git switch mybranch to go to the branch.
9. use "~~vi file1.txt~~ "Vi 'GJ.txt'" to create a txt file called

GJ

10. Use the commands, git add & then commit, to stage & then later commit the file

11. Then we use the command,

git log --oneline --graph to see ~~where the~~ if branch is pointing towards the new commit

12. Use git switch ~~master~~ 'main' to return to master branch.

13. To check the condition, we use git log --oneline --graph

14. ~~Use~~ Use 'vi file2.txt' to create the file
- Use git add 'file2.txt' to stage it

Finally use git commit to commit the changes.
